

## John T. Hickerson WRF Rehabilitation El Paso Water

### CLIENT

El Paso Water

### LOCATION

El Paso, TX

### ROLE

Procurement Services

### COST/SIZE

\$22.5 Million

The John T. Hickerson Water Reclamation Facility treats residential and industrial wastewater generated in northwest El Paso. Built in 1989 and later expanded in the 1990s, the system has been operating only on the newer 12.5 million gallons per day (MGD) treatment train since the expansion. To increase capacity, El Paso Water (EPW) will rehabilitate the original (5 MGD) train to bring it back in service.

El Paso Water awarded ECM the professional engineering services contract to provide procurement services and act as the primary point of contact throughout the selection of a design-build team. ECM also assisted in the creation of the performance specifications, completed system modeling, and conducted treatment train assessments.

To date, ECM has successfully completed the pre-construction and early work packages, and is currently managing the construction.
